

# Group Theory

Summer School, Exam 2  
Gümüşlük, August 3, 2001  
Ali Nesin

**1.** Let  $G$  be a set together with an associative binary operation  $(x, y) \mapsto xy$ .

**1a.** Assume that for all  $a, b \in G$  there are unique  $x, y \in G$  such that  $ax = ya = b$ . Show that  $G$  is a group under this binary operation.

**1b.** Assume that for all  $a, b \in G$  there is a unique  $x \in G$  such that  $ax = b$ . Is  $G$  necessarily a group under this binary operation?

**2.** Let  $H$  and  $K$  be two subgroups of  $G$ . Show that for  $x$  and  $y$  in  $G$ ,  $xH \cap yK$  either is empty or a coset of  $H \cap K$ .

**3.** Let  $H$  and  $K$  be two subgroups of  $G$ . An  $H$ - $K$ -coset of  $G$  is a subset of  $G$  of the form  $HxK$  for some  $x \in G$ . Show that the  $H$ - $K$ -cosets of  $G$  partition  $G$ .

**4.** Let  $A$  and  $B$  be two simple nonabelian groups<sup>1</sup>. Find all normal subgroups of  $A \times B$ .

**5.** Find a group  $G$  that has a proper subgroup isomorphic to itself.

**6.** Let  $G$  be a group generated by  $x_1, \dots, x_n$  and let  $m \in \mathbb{N}$ . Show that the set

$$G[m] = \left\{ x_{i_1}^{r_1} \dots x_{i_k}^{r_k} : k \in \mathbb{N}, \sum_{j=1}^k r_j \equiv 0 \pmod{m} \right\}$$

is a normal subgroup of index at most  $m$  of  $G$ . Show that  $G/G[m]$  is a cyclic group whose order divides  $m$ .

**7.** Classify all abelian groups which satisfy DCC on subgroups<sup>2</sup>.

**8a.** Let  $A$  and  $B$  be two groups. Assume  $B$  is abelian. Let  $\text{Hom}(A, B)$  be the set of group homomorphisms from  $A$  into  $B$ . For  $f, g \in \text{Hom}(A, B)$  define  $f \cdot g$  by the rule

$$(f \cdot g)(a) = f(a)g(a) \quad (a \in A).$$

Show that the set of group endomorphisms  $\text{Hom}(A, B)$  from  $A$  into  $B$  form an abelian group under the addition of functions.

**8b.** Let  $n$  and  $m$  be two integers  $> 0$ . Show that  $\text{Hom}(\mathbb{Z}/n\mathbb{Z}, \mathbb{Z}/m\mathbb{Z}) \approx m'\mathbb{Z}/m\mathbb{Z} \approx \mathbb{Z}/d\mathbb{Z}$  where  $m' = m/d$  and  $d = \text{gcd}(m, n)$ .

**9.** Find  $C_{\text{Sym}(n)}(1\ 2)$ .

**10.** Let  $H$  and  $K$  be two subgroups of finite index of  $G$ . Show that  $H \cap K$  has also finite index in  $G$ . Show that  $H$  has finitely many conjugates in  $G$ . Conclude that if a group has a subgroup of finite index, then it has a normal subgroup of finite index.

---

<sup>1</sup> A group  $G$  is called simple if  $1$  and  $G$  are the only normal subgroups of  $G$ .

<sup>2</sup> A group is said to satisfy descending chain condition (DCC) on subgroups, if there is no infinite descending chain of distinct subgroups.

**11.** Show that  $\mathbb{Q}^+$  and  $\mathbb{Q}^*$  are not finitely generated.

**12.** Let  $P$  be a Sylow  $p$ -subgroup of  $G$ . Show that  $P$  is characteristic in  $N_G(P)$ . Conclude that  $N_G(N_G(P)) = N_G(P)$ . Show that if  $G$  is nilpotent,  $N_G(P) = G$ , i.e.  $P \triangleleft G$ .

**13.** Let  $t \in G$  be an involution<sup>3</sup>. Let  $X = \{[t, g] : g \in G\}$

**a.** Show that for  $x \in X$ ,  $x^t = x^{-1}$  and that  $t \notin X$ . Conclude that the elements of  $tX$  are involutions.

**b.** Show that the map  $\varphi : G/C_G(t) \rightarrow X$  defined by  $\varphi(gC_G(t)) = [t, g^{-1}]$  is a well-defined bijection.

**c.** Assume from now on that  $G$  is finite and that  $C_G(t) = \{1, t\}$ . We will show that  $X$  is an abelian 2'-subgroup<sup>4</sup> and  $G = X \rtimes \{1, t\}$ . By part b,  $|X| = |G|/2$ . By part a and by assumption,  $X$  has no involutions. Therefore  $X \cap tX = \emptyset$ . Conclude that  $G = X \sqcup tX$  and that  $X$  is the set of elements of order  $\neq 2$  of  $G$ . Therefore,  $X$  is a characteristic subset of  $G$ . Let  $x \in X \setminus \{1\}$  be a fixed element. Conclude that  $t^x$  inverts  $X$  as well (replace  $t$  by  $t^x$ ). Conclude that  $1 \neq x^2 = tt^x$  centralizes  $X$ . Therefore  $X = C_G(x^2) \leq G$ . Since  $t$  inverts  $X$ ,  $X$  is an abelian group without involutions.

**14.** Let  $G$  be a finite group with an involutive automorphism<sup>5</sup>  $\alpha$  without nontrivial fixed points. Show that  $G$  is inverted by  $\alpha$ .

**15a.** Let  $G$  be a group of prime exponent  $p$ . Show that for  $g \in G^*$ , no two distinct elements of  $\langle g \rangle$  can be conjugated in  $G$ .

**b.** Show that if  $\exp(G) = p$ , then  $G$  has at least  $p$  conjugacy classes.

**c. (Reineke)** Let  $G$  be a group and assume that for some  $x \in G$  of finite order, we have  $G = x^G \cup \{1\}$ . Show that  $|G| = 1$  or  $2$ .

**16.** Let  $G$  be an arbitrary torsion group without involutions. Show that  $G$  is 2-divisible. Assume  $G$  has an involutive automorphism  $\alpha$  that does not fix any nontrivial elements of  $G$ . We will show that  $G$  is abelian and is inverted by  $\alpha$ .

**a.** Show that for  $a, b \in G$ , if  $a^2 = b^2$  then  $a = b$ .

Let  $g \in G$ . Let  $h \in G$  be such that  $h^2 = g^\alpha g$ .

**b.** Show that  $(h^\alpha)^2 = (h^{-1})^2$ . Conclude that  $h^\alpha = h^{-1}$ .

**c.** Show that  $(gh^{-1})^\alpha = gh^{-1}$ . Deduce that  $g = h$ . This proves the result.

<sup>3</sup> An involution of a group is an element of order 2.

<sup>4</sup> I.e. has no elements of order 2.

<sup>5</sup>  $\alpha \in \text{Aut}(G)$  is an involutive automorphism if  $\alpha(\alpha) = 2$ .
